## StyleMagic YA

Question: What do you do? A: If it's not already on your sound file this lets you control a lot of the spectrum of your midi song and program it accordingly to sound like an artist or create a unique sound for an instrument. Some people use it for different things, but I use it to learn how to play a specific instrument on a midi instrument which I own.

```
import axios from 'axios'; //
API_BASE_URL is simply the config variable that holds the path to your API endpoint. // // This is where the variables `client`
and `admin` come into play. The admin access point is where you would // authenticate users of the application or use
authentication middleware. The `client` is your general purpose API wrapper // that is available to your entire app. const
API_BASE_URL = process.env.API_BASE_URL; const client = axios.create({ baseURL: API_BASE_URL, timeout: 5000,
withCredentials: true }); // The `admin` API endpoint is available to your users, in order to enable the API in your app. // To do
this, you simply set the `adminUrl` variable on the client (client). const admin = axios.create({ baseURL: API_BASE_URL,
timeout: 5000, withCredentials: true }); // API endpoints are available to both clients and admins. // // GET: /admin/resources //
// Response: // // { // data: // { // name: "My Cool Resource" // description: "Cool resource!" // }, // ok: true, // message:
undefined, // status: 200 // } // // // GET: /admin/connections // // Response: // // { // data: { // name: "connection1", //
description: "Connect this file to thing!" // kind: "standard", // resource: "file" // },
```
